

Act on shared goals. Create collective impact.

Metaimpact is a new kind of global digital infrastructure enabling organizations to build purpose-driven impact networks to confront the world's biggest problems. Big problems are not everyday problems; rather, they encompass challenges that resist straightforward definitions, have no end to the number of potential solutions, and can't be solved by a single organization acting independently.

Closing the racial wealth gap

Meeting workforce needs

Making health care available & affordable

Advancing climate solutions

Increasing access to mental health services

Building community & place

Organizations worldwide are dedicated to confronting big problems, but any kind of technology to support the systems-level change required to solve these problems has been wholly lacking. With Metaimpact, these organizations can design, build, and deploy digital impact networks where contributing stakeholders can act on shared goals and monitor performance with a shared system of measurement.

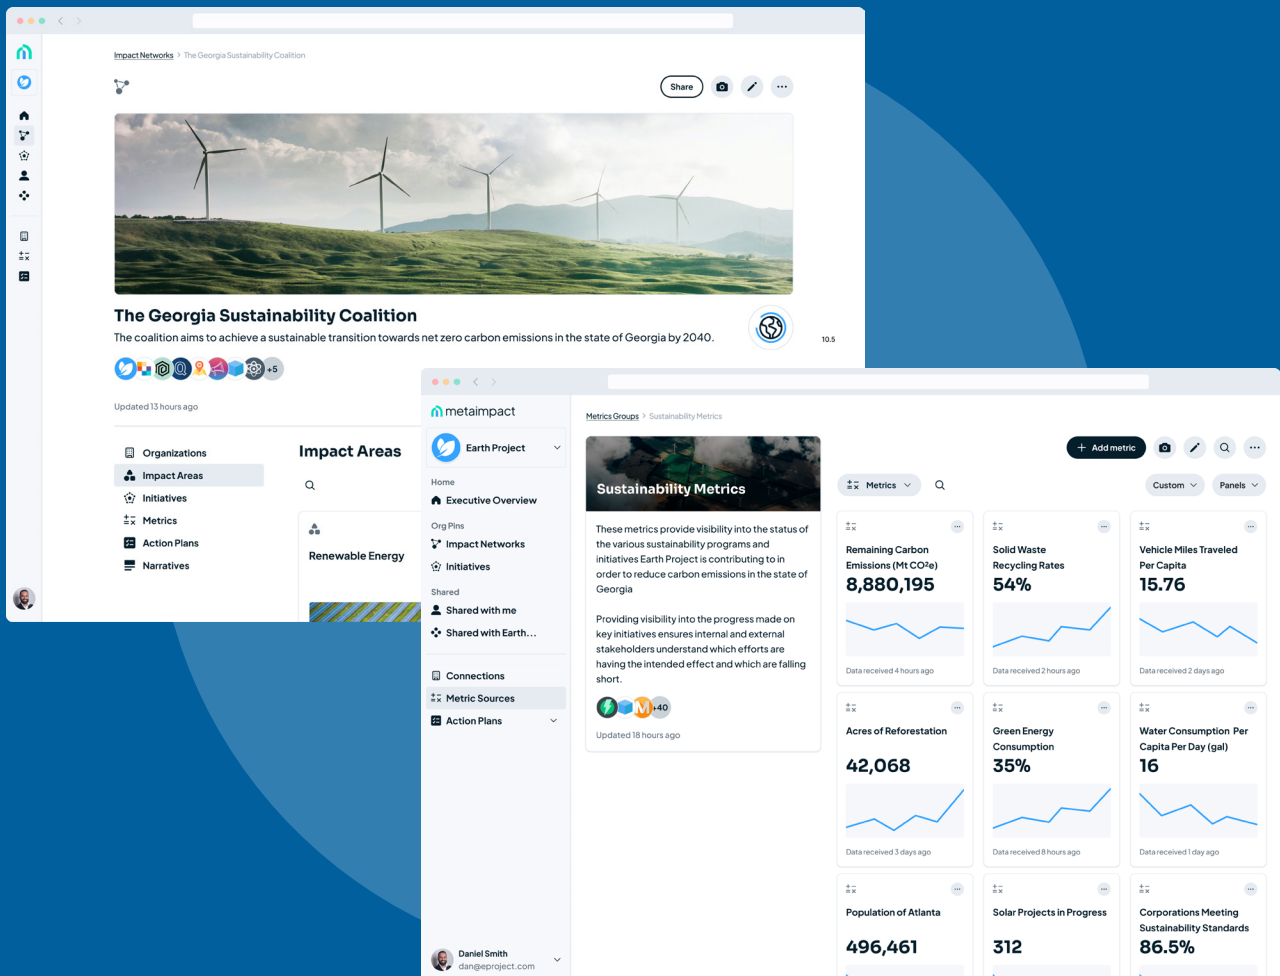

Impact networks within the Metaimpact platform are self-organizing and can interconnect in any combination, creating a nexus of commercial enterprises, nonprofit organizations, and government agencies where change makers can engage and collaborate on pressing world issues. This is important because big problems can't be solved one by one. Real progress requires a comprehensive approach that tackles the entangled, overlapping issues that contribute to the whole.

At its core, Metaimpact is a persistent, digital representation of the real world, where the impact of many organizations' collective efforts can be applied, measured, and quantified—a neutral space where stakeholders can self-organize, actively collaborate, and create impact velocity at scale.

We invite you to join Metaimpact, where your contributions can shape the course of our shared future. Get started at metaimpact.com.

Act on shared goals. Create collective impact.
